

# Agentic Blackboard 中文案例报告

重点：新架构下 agent 如何根据 blackboard 自主选择下一步

|          |                                                        |
|----------|--------------------------------------------------------|
| 目标       | MLA-like alkaloid case                                 |
| 重原子 / 环数 | 25 / 5                                                 |
| 最终结论     | fake_closed_rejected (fake_closed_rejected)            |
| 测试门禁     | pytest -q: 279 passed, 2 skipped, 7 warnings in 76.17s |

## 核心结论

系统不再固定执行 failure -> scout -> extract -> rerun。每轮由 blackboard 汇总目标、失败、文献、类比和预算状态，planner 只选择 typed actions；最终 solved 必须由 deterministic parent proof 证明。

# 新架构说明

Policy-driven DAG + Blackboard, 外加确定性验证边界

1. Planner 只能选择 action, 不能直接输出 reaction SMILES 或 solved verdict。
2. 每个 action 都有 rationale、expected\_artifact、success\_condition, 并经过 schema/budget 校验。
3. Failure critic 会把 large\_atom\_jump、plugin\_not\_invoked、advanced terminal 转成 bridge tasks。
4. 精确文献行进入 exact evidence ; 类比假设只影响排序和搜索策略, 不能作为 proof。
5. 最终 solved 需要 stitched\_parent\_route\_proof.v1 ; child solved 不能自动升级 parent solved。

## 本次 blackboard 摘要

route\_failures=4 | bridge\_tasks=10 | terminal\_blacklist=1 | exact\_rows=1 | selected\_analogies=3

# Agent 决策过程

每一轮都从 blackboard 状态出发，选择一组 typed actions

## 第 1 轮 - 生成目标侧断键假设 [generate\_disconnection\_hypotheses]

决策理由：MLA-like 目标在任何重跑前都需要先识别目标侧功能手柄和断键区域。

期望产物：target\_side\_disconnection\_hypotheses.v1

成功条件：生成 aryl ester、imide、cage、amine 等 advisory tasks。

## 第 1 轮 - 构建失败批判报告 [build\_failure\_critic\_report]

决策理由：先前 route verifier 已发现大重原子跳跃和高级终端，需要归一化成 bridge tasks。

期望产物：failure\_critic\_report.v1

成功条件：记录目标侧 bridge、terminal blacklist 和下一轮 action bias。

## 第 1 轮 - 检索目标近端文献 [search\_literature]

决策理由：bridge tasks 需要目标近端文献候选，之后才适合 exact replay。

期望产物：literature\_scout\_report.v1

成功条件：scout 产出 source candidates 和 extraction recommendations。

## 第 2 轮 - 编译精确文献行 [compile\_exact\_literature\_rows]

决策理由：已有 mock source-detail 行；它只能编译为 exact evidence，不能作为 solved proof。

期望产物：compiled exact literature rows

成功条件：一个 exact row 进入 literature\_evidence.exact\_rows。

## 第 2 轮 - 排序类比假设 [rank\_analogical\_hypotheses]

决策理由：在 exact row 上下文存在后，对 advisory hypotheses 排序。

期望产物：analogical\_hypothesis\_ranking.v1

成功条件：被选中的 hypotheses 保留 required verification 和 no\_solved\_claim。

## 第 2 轮 - 停止并保持未解决 [stop\_unresolved]

决策理由：不存在 stitched parent proof，因此停止探索并避免 solved claim。

期望产物：unresolved stop marker

成功条件：最终 verdict 保持 unresolved/partial/rejected，不会变成 solved。

# Blackboard 状态更新

失败不是最终报告里的文字，而是下一轮行动的输入

---

## 路线失败

- 出现无法解释的大重原子跳跃 [large\_atom\_jump]
- 文献模板插件未被后端调用 [literature\_template\_plugin\_not\_invoked]
- 把高级同骨架中间体误当作库存终端 [advanced\_same\_scaffold\_terminal]
- 插件产物命中为零，文献行暂未连到目标 [plugin\_product\_hits=0]

## 桥接任务

- 需要目标近端桥接 [target\_proximal\_bridge\_required]：Find a target-proximal intermediate that explains the large skeleton change.
- 需要桥接到文献产物 [bridge\_to\_literature\_product\_required]：Find a target-side bridge before replaying exact source products.
- 需要高级终端的上游合成 [upstream\_terminal\_synthesis]：Find upstream synthesis for rejected same-scaffold terminal.
- 精确复播前需要目标侧桥接 [target\_side\_bridge\_before\_source\_replay]：Treat literature rows as disconnected until a target-proximal bridge is found.
- 目标近端桥接任务 [target\_proximal\_bridge]：core alcohol or phenol plus activated anthranilate/imide acid fragment
- 目标近端桥接任务 [target\_proximal\_bridge]：preassembled imide or succinimide-containing acid/activated fragment
- 目标近端桥接任务 [target\_proximal\_bridge]：target-proximal cage intermediate with matched ring system

## 终端黑名单

- CN1CC2CCC1CC2OC(C)=O

## 被选中的 advisory hypotheses

- target\_side\_analogue\_diene\_iminium\_scaffold\_inspiration, score=15, 必须验证：target\_proximal\_bridge, deterministic\_parent\_proof
- target\_side\_analogue\_diene\_iminium\_scaffold\_inspiration, score=15, 必须验证：target\_proximal\_bridge, deterministic\_parent\_proof
- target\_side\_aryl\_ester\_or\_anthranilate\_disconnection, score=15, 必须验证：target\_equivalence, target\_core\_retention, exact\_literature\_segment\_connected\_to\_parent\_route

# 测试、PDF 审计与最终门禁

测试通过不等于 solved ; solved 仍必须有 parent proof

全量测试门禁 : pytest -q: 279 passed, 2 skipped, 7 warnings in 76.17s

最终 verdict 为 fake\_closed\_rejected, route\_status 为 fake\_closed\_rejected。这是预期行为：文献 exact rows 和 analogy ranking 只能支持探索方向，不能替代证明。若要宣称 solved，必须出现 stitched\_parent\_route\_proof.v1，并同时满足 target equivalence、parent verifier accepted、stock audit、无 unexplained large atom jump、child-parent 连通和 exact-literature 连通。
