

最终修正版结论

01

依据strict visual clean bundle，而不是旧污染bundle

结论

最终clean verdict为solved。成立条件是：strict visual文献链15步通过连续性和target identity审计；strict terminal 11作为exact子目标重新搜索并被verifier接受；stitch审计确认terminal与子目标完全同一分子。

bufotalin

文献链

23/61

exact terminal solved

拼接

23 步

8 + 15

Clean verdict

solved

stock audit passed

必须保留的限定语

这不是说原生ChemEnzy或旧guided rerun直接成功。它们仍是负例，保留为假闭合防线。真正成功的是strict visual source-detail文献链与exact terminal子目标路线的确定性拼接。

化学边界

仍需人工复核的部分是视觉结构中的早期steroid立体化学，尤其11/24/25/23/26/27/28和26的wavy C-Br。自动化结论可作为严格审计后的候选闭合路线，不应替代人工化学审稿。

这次修正了什么

02

旧PDF的结论入口需要换成clean strict visual verdict

旧入口为什么不对

旧strict verdict文件仍显示fake_closed_rejected，原因是bundle里混入了旧guided/native raw artifacts，触发raw_reaction_injection/open timeout等guard。这是bundle污染问题，不是strict visual stitch本身失败。

新入口

修正入口是clean bundle：validation accepted=True，reasons=-，final verdict=solved。

不能偷换 terminal

另一个关键修正是terminal：strict visual链里的compound 11与早先hard-coded compound 11的InChIKey不同。因此不能复用旧子目标闭合，必须按strict terminal重新跑exact subgoal search；本次已经重跑并通过。

结构链验证

验证结果：accepted=True，status=validated。
step_count=15，accepted_step_count=15，
compound_count=16，chain_contiguous=True，
target_match=True。

来源说明

这条链来自strict vision repair
后的确定性规范化。它不是复用旧source-detail
记录；每一步都经过RDKit parse
和相邻主反应物/产物连续性检查。

corresponding vinyl iodide 14 using sequential treatment of hydrazine monohydrate and then I_2 . Moving forward, a Stille reaction was employed to install the E ring in the presence of $Pd(PPh_3)_4$, CuCl, LiCl in DMF along with THF as the co-solvent, providing the required adduct 22 (1:1). Introduction of oxidation state at C16 was achieved by epoxidation of the 16,17-double bond of 22 with mCPBA and the acid scavenger sodium carbonate in DCM at -78°C to give epoxide 30 as a single diastereomer (1:1). Surprisingly, the electron-rich 2-pyrone ring remained unreactive under this condition. Subsequent epoxide rearrangement was finished under the catalysis of TMSOTf, with 2,6-lutidine as the base, affording C16-carbonyl compound 31. A nonspecifically reduction of 31 with NuH_2 in MeOH and THF gave C16 β -oriented hydroxyl product 32, which was further acylated using acetic anhydride in pyridine gave 33. Finally, deprotection of the silyl ester by pyridine hydrofluoric acid afforded the target natural product bufotalin (1).

3. Conclusions

In summary, we have finished an efficient total synthesis of bufotalin (1) in 13 steps from the cheap and commercially available steroid an-drostenedione (11). Diastereoselective reduction of C3-carbonyl and C16-ol were considered to accomplish the transformation of A ring (11).

Entry	X (equiv.)	Additive	Solvent	Yield (%)
1	1.2	-	Dioxane/ H_2O	38
2	1.0	-	Dioxane	8
3	1.0	-	Dioxane/ H_2O	36
4	1.0	-	DMF	8

8	1.0	Formic acid	DMF	8
9	2.0	Formic acid	Dioxane/ H_2O	22
10	1.0	Formic acid	Dioxane/ H_2O	43
11 ^a	1.2	Acetic acid	Dioxane/ H_2O	40
12 ^b	1.2	Formic acid	Dioxane/ H_2O	35
13 ^b	1.2	-	Dioxane/ H_2O	10

^a The reactions were conducted on 1.0 mmol of 19 under different conditions at 125 $^\circ\text{C}$.

^b Isolated yields.

^c 1.0 equiv. of formic acid was used.

^d 0.5 equiv. of formic acid was used.

^e 1.0 equiv. of acetic acid was used.

^f 2.0 equiv. of formic acid was used.

^g The ratio of dioxane to water is 2:1.

construction of C14 β -OH can be completed with a moderate yield, it is difficult to selectively protect C3-OH later.

With 20 as a key intermediate, the double bond was hydrogenated catalyzed by Pd/C. For finishing constructing the scaffold of bufotalin by Stille cross-coupling, the C17-ketone was transformed to the

scheme3_full_to_20

scheme4_total_synthesis

table1_allylic_oxidation

strict terminal 11与旧hard-coded 11不同

strict visual terminal 11

old hard-coded compound 11

本次使用的 terminal

strict terminal
InChIKey=AEMFNILZOJDQLW
-QAGGRKNESA-N。该分子是
strict visual文献链最后一步的真实terminal，后续
exact subgoal search使用的就是它。

旧 terminal

旧hard-coded 11
InChIKey=AEMFNILZOJDQLW
-MGGVOPSTSA-
No. matches_previous_hard
coded_compound_11=False
，所以不能复用旧子目标结果。

为什么这一步关键

这个修正是本轮汇报最重要的地方：如果把两个11混为同一分子，stitch
会在交界处出现立体化学错误。现在的最终路线只基于strict terminal自己的exact target verifier。

重新跑exact subgoal，不复用旧结果

子目标结果

exact subgoal search
已通过：route_status=solved
， route_count=61, accepted_route_count=23, best_route_rank=2, best_route_step_count=8。

exact target 审计

目标等价审计通过：request
InChIKey=AEMFNILZOJDQLW
-QAGGRKNESA-N, backend
InChIKey=AEMFNILZOJDQLW
-QAGGRKNESA-N, match_basis=canonical
_isomeric_smiles_and_inchikey。

搜索目标

strict 11

非旧hard-coded 11

候选路线

61

ChemEnzy raw candidates

通过路线

23

verifier accepted

最佳路线

rank 2

8 steps

警告解释

stitched route里仍保留`subgoal\_verifier:large\_atom\_jump`警告，因为部分候选路线失败；但verifier接受了满足target identity和stock closure的候选路线，因此作为警告而不是拒绝理由。

stock到strict terminal，再由文献链到bufotalin

stitch 审计

stitch
accepted=True, solved=True, route_status=solved, stock_audit_passed=True。
。

交界身份

交界terminal
InChIKey=AEMFNILZOJDQLW-QAGGRKNESA-N。文献链
terminal与子目标target的canonical isomeric SMILES / InChIKey完全一致。

stock → strict terminal → bufotalin

stock 到 strict 11 : 8 步

strict 11 到 bufotalin : 15 步

合计23步，stitch route_status=solved。

路线组成

完整路线共23步：stock到strict terminal的8步子目标路线，加上strict terminal到bufotalin的15步文献链。

clean solved与旧失败证据并存

原生负例

原生ChemEnzy
仍未通过：route_status=fake_
closed_rejected, accepted_
route_count=0, reasons_
=advanced_same_scaffold_
terminal、large_atom_ju
mp、no_verifier_accepted_
stock_closed_route。

guided 负例

guided rerun
也未解决目标：route_status=fak
e_closed_rejected, reaso
ns=advanced_same_scaffo
ld_terminal、large_atom_
jump、no_verifier_accept
ed_stock_closed_route。它
不能覆盖
route verifier。

clean bundle 的作用

旧strict verdict
的拒绝原因为：advanced_same_scaffold_terminal、fake_closure_
evidence_present、large_atom_jump、no_verifier_accepte
d_stock_closed_route、open_structure_research_timeout
、raw_reaction_injection。clean
bundle validation则accepted=True, reasons=-。也就是说，最终solved来自clean deterministic
artifacts，而不是忽略失败证据。

复现时优先看这些文件

文件入口

clean summary: run_dir/bufotalin_strict_visual_continuation_clean_summary.json；修正版总摘要
clean verdict: run_dir/final_verdict_strict_visual_clean.json；最终solved判定

clean bundle: run_dir/artifact_bundle_strict_visual_clean.json；无旧raw artifact污染的bundle

最终汇报语句

最终正确表述：AutoPlanner对bufotalin给出一条strict-visual source-detail文献链与exact strict-terminal子目标路线拼接而成的stock-closed semisynthesis candidate。系统clean verdict为solved；化学发布前仍需人工核对早期steroid立体化学。
